# ABOUT ME

I am Daniil Medvetsky, 18 years old, and I am passionate about programming, cycling, and gaming.

The project is a system consisting of a Telegram bot and a Flask-based web application. It allows users to add, edit, and delete news through the Telegram bot. The news is then displayed on the website.

# TARGET AUDIENCE

## Simplicity

Website owners and administrators who want a simplified way to manage content.

## Versatility

Telegram users who need to quickly publish news without direct access to a website.

## Efficiency

Companies and organizations using Telegram for internal communication and information dissemination.

# GOALS AND CAPABILITIES OF THE PROJECT

## Цели

### Simplifying News Publication:

- Provide users with a simple and convenient way to add, edit, and delete news through the Telegram messenger.

### Channel and Web Expansion:

- Enable users to expand their Telegram channel's reach to the web, thereby promoting and growing their channel effectively.

### Adding News:

- Users can submit news through the Telegram bot, including the headline, description, text, and photos.

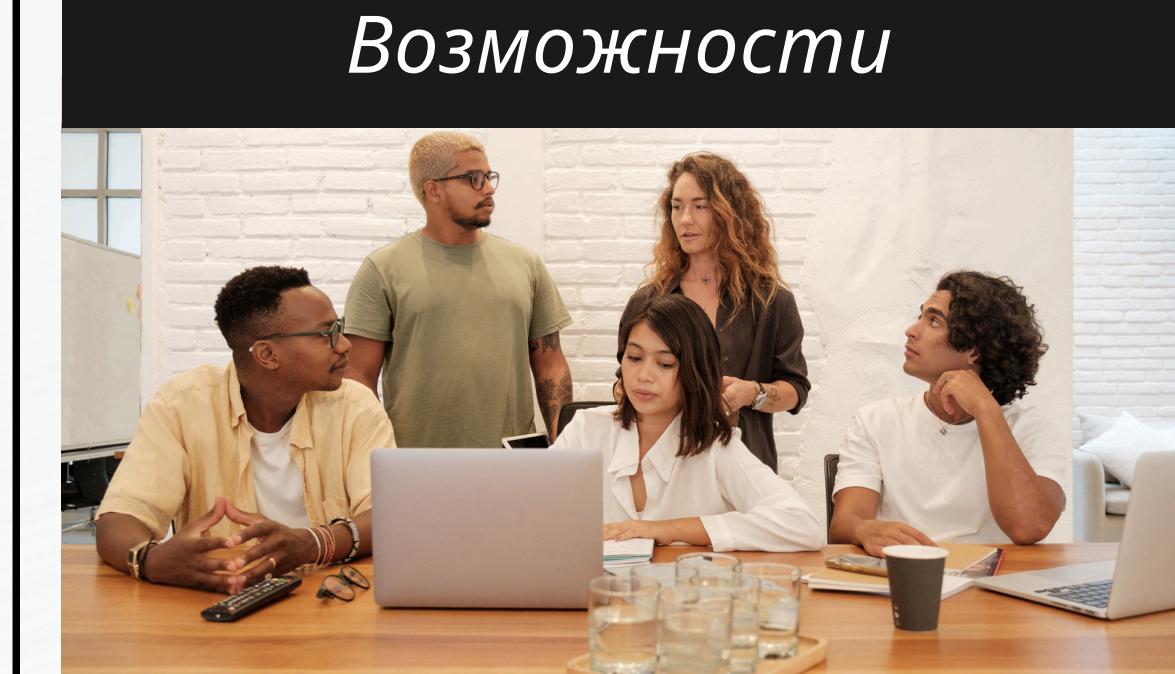

### Editing and Deleting:

- People have the ability to edit and delete published news directly via Telegram.

### Displaying News:

- News added through Telegram is automatically displayed on the website, ensuring up-to-date content for users.

## Возможности

# MODULES FOR DEVELOPMENT AND FUNCTIONS

- Receives user commands (start, add news, edit news, delete news).
- Collects information about the news (title, photo, description, text).
- Sends data to the server for adding, editing, and deleting news.

Library:  
**pyTelegramBotAPI**

- Processes data received from the Telegram bot.
- Manages news (adding, editing, deleting) with storage in the SQLite database.
- Displays news on the website.

LIBRARY:  
**FLASK**

Stores information about the news, including:

- Identifier
- Title
- Description
- Text
- Photo path

**sqlite3**

# KEY CODE COMPONENTS

```
@bot.message_handler(func=lambda message: True)
